Transforming how claims are paid

Optum Payment System Interface (PSI) is a web-based claim pricing platform for payers.

Optum® Payment System Interface framework enables a user's workflow to be seamless and self-directed, unlocking the ability to go beyond simple batch claims processing to individual claim auditing and even advanced analytics. PSI enables payers across Medicare, Medicaid and commercial lines of business to review claim pricing in greater detail than ever before. Its biweekly regulatory updates increase payment accuracy, allowing payers to spend more time using their data and less time managing it. PSI is flexible, scaling easily to each payer's unique business.

Accuracy: Price claims correctly the first time

PSI maintains up-to-date data from the Centers for Medicare & Medicaid Services (CMS), state Medicaid and other regulatory sources to ensure payers are accurately pricing claims the first time. PSI synchronizes data sources to ensure payers can use the latest regulatory content as soon as they are ready to deploy it. And in the event that a payer needs to reprice a claim, PSI advanced filters allow users to pinpoint specific claims requiring attention and reprice them without IT intervention.

Transparency: See how claims are priced

PSI shows you how each claim was priced so you can be confident it was priced accurately. Pricing worksheets are included that show you the step-by-step pricing calculations used. These worksheets can be reviewed for quality assurance and shared with auditors or providers to help settle claims pricing disputes. Each iteration of a claim can be stored in the PSI database, so you can easily review both the current priced amount for a claim and any prior priced amounts.

Flexibility: Implement PSI to fit your business, not the other way around

PSI can process 10 claims as easily as it can process 10 million. It can import batches of claim data in almost any format that your system can output, and it can provide pricing in real time via the built-in RESTful web service Application Programming Interface (API). Batch processing can be performed ad hoc or predefined and scheduled in advance to occur once or multiple times on specific days and times. When a batch of claims is needed for modeling or repricing, it can easily be extracted from the PSI database, thereby reducing the frequency with which you need to extract claims from your data warehouse or require IT intervention. PSI can be customized as little or as much as your business requires.

PSI enables payers with Medicare, Medicaid and commercial lines of business to be more transparent with providers

Features of Optum Payment System Interface

Feature	Payment System Interface
Transparency	• Pricing Worksheets — 30+ reimbursement systems (Medicare, Medicaid) • Iterative claim history
Batch processing	• Scalable, unlimited • Multiple claim file processing • 837i/p integration • Optimized processing speed • Upload/download batch files via UI, reducing IT involvement • Scheduled or ad hoc
User interface	• Payer focused • Advanced search criteria (query over 50+ data points)
Reporting and modeling	• Import claims • Reprice based on Medicare, Medicaid • Compare rates across facilities • Override existing contract information to perform what-if analysis • Claims reporting
Integration with Optum products	• Regulatory Portal • Rate Manager, Rate Manager Pro
Reference and coding support	• APC Assistant™ add-on • Encoder and clinical reference add-on
